## 2 Research Interests

I am a fourth-year PhD candidate in UIUC, majoring in operations research, and currently doing research in mechanism design. In general, my research interests span a wide scope related to incentive-aware design and optimization for emerging applications in digital economy, including blockchain systems, e-commerce, ridesharing platforms and so on. I am also interested in data-driven mechanism design based on statistical/online learning, and topics in cryptography and distributed systems with applications in blockchain.

Particularly, I am recently interested in the exploration into a novel paradigm of *incentive security* on blockchain and AI platforms, which aims to combine game-theoretic and systematic/cryptographic methodologies to prevent dishonest behavior of *untrusted but rational* parties.

On a high level, my (starry-eyed) dream [i\*] lies in the exploration and design of **Sustainable Decentralized Trustworthy AI** platforms. Following are the topics I am actively working on:

- **AI for mechanism design** [#A4M]: e.g., using data-driven methods to improve the performance of economic platforms.
- **Mechanism design for AI** [#M4A]: e.g., using economic incentives to reinforce the efficiency and security of AI systems, especially on the blockchain platform.
- **Sustainability in AI & Economy** [#SUS]: e.g. using interdisciplinary methodologies to foster long-term social welfare and environmental friendliness for new-era AI and economic platforms.

Additionally, I was interested in geometry-based computer graphics and vision at my undergraduate times. Although I no longer focus on that research field, I am still happy to discuss about related topics, especially the recently fruitful field of embodied AI [#EAI].
